Bunq Challenge
How to bring the model to production

1) Production server records data and add it to the database

Production Server

3) The parameters of the model are updated

Database

2) The data is used to continuously update the model

Training Server
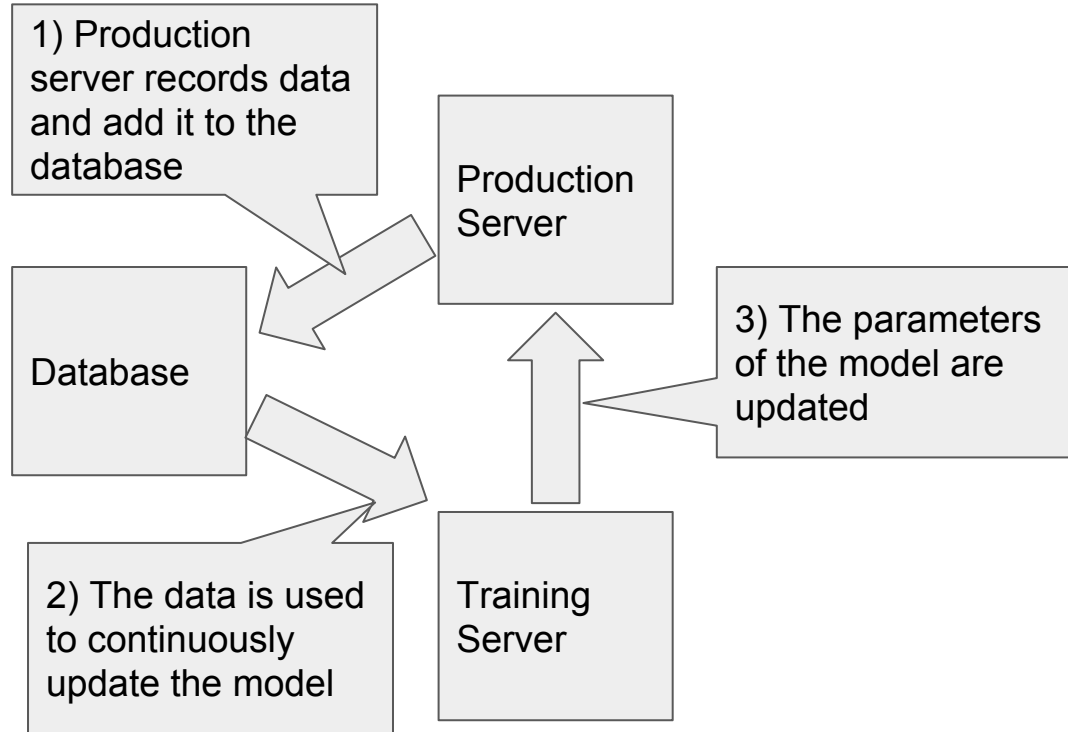

The cycle can be done once every day, every week or every month, depending on how costly it is to train the model and how often we expect the customer behaviour to shift.

AWS has the infrastructure to handle the cycle. It also offers plenty of tools to extend the predictive model in future stages.
